They can also take advantage of the vulnerability to carry out further system enumerations and obtain the information they need to allow a combined attack through carriers such as LFI and RFI.Directory Traversal Examplespie Directory Traversal (Punta Drot-Punto attack) the easier example of At the attack of the directory crossing is when an application is displayed or allows the user to download a file via a URL parameter. For example, if the user supplies the Document.pdf file name and the website download the PDF to the user's computer via this URL: https://www.vulnerable.com/download\_file.php? File = Document.pdfif The website is hosted on a Linux system, the website files are generally archived in /var/www which is two directories above the root. The attacker can exploit it, passing this as a file name: ./././ etc. the application does not sanitize the entrances, uses the striker's string directly in a system call, passes at the root and therefore allows it The striker to access the / ETC / ETC /. It therefore allows the attacker to access the protected passwd file. A similar attack can be performed on a Windows system using the \ string .. Use of cookies for the Traversalin directory many cases, the reference directories of cookies on a web server to upload the required files for a website. This exhibits the site to an attack on the directory. For example, consider a cookie accessing a file to load a new design model for a website: In this scenario, the name of the file is archived in the design cookie and added to a Since there is no validation of the \$ Design variable, an attacker can send an GET HTTP request that changes the value of the design cookie = ././etc/passwd the web server would perform the following system call, loading the Passwd Passwd files id tset li etnarud erarediscoc ad ittepsa isrevid itacnele onos otugas ID ,elif id itnemacirac e LMTH iludom ,TEG e TSOP ,PTTH etamaihc emoc ,etnetu'lled tupni'l erattecca onosop ehc enoizacilppa'lled ltenenopmoc i itutt odnaccificeps olraf onosop retset I ,tupni'lled adilavnoc alled enoisule'lla elbarenluv .?A beW enoizacilppa' nu id acificeps etrap elauq erepas id olleuq .?A ovittebo'L ,ossegrnii id irottev i itutt id acitametisis enoizatulav anu erffo ossegrni id irottev ied enoizaremune'L ,imetisis jen occatta id irottev eravelir rep atazzilltu acinctet anu .?A enoizaremunEtupni id irottev ied enoizaremuneE.)PSAWO( beW enoizacilppa'lled azzerucis id ottegorp lad itaigisnoc idotom isrevid occE ,beW enoizacilppa e ,etnatsottos ovitarerop ametisis li e beW revres led erawfos li oserpmoc ,erawtfoS li otanoiriga erenentnam onoved irotartsinimma ilG ,Atilbarenluv elled tseT,otnematturfs id .Atilbissop al erurdir e azzerucis al rep ihcsir i ovitacifingis odom ni erurdir ?Aup erawtfoS la hctap etnemraloger eracilppa id acitarp al ,azzerucis id hctap el ettut eracilppa e ,etnatsottos ovitarerop ametisis li e beW revres led erawfos li otanoiriga erenentnam onoved irotartsinimma ilG ,itnaccatta ilgad itazillitu etnemenumoc epacse id icidoc ©Ahncon idnamoc onognetnoc ehc LRU ilg eraccolb rep irtlif azzillitu bew inoizacilppa elled etrap roiggam aL ,ottepos etnetu tupni'l eraccolb rep irtlif erazzillitu onoved inoizacilppa eL ,ecidar yrotcerid anu a ossecca'l itnaccatta ilga eredeccnoc onosop e ossecca id igelivirp i onaloiv ehc ,noitcejni LQS emoc ,odnamoc id ehcinctet erazzillitu id otidepmi ais itnaccatta ilga ehc eritnarag a eratuaia ?Aup tupni'lled adilavnoc aL ,resworb iad otattecca etnetu tupni'l eradilavnoc onoved irotappulivis ilg :osrocrep otnemasrevartta ihccatta erineverp rep erazzillitu elibissop ?A ehc idom isrevid occEosrocrep otnemasrevartta enoizneverP:.)dwssap/cte/./././sniks/./.(edulcni.enoizattegorp id olledom led appearance:A can you find request parameters that can potentially be used for file-related operations? For example: detected unusual file extensions? For example: do you see any interesting variable names? For example: next phase of this security testing process involves analyzing all input validation functions in the tested web application. To quickly test an existing web application for directory traversal vulnerabilities, you can use the following technique:Insert relative paths into files existing on your web server. For example:./././././etc/passwd on Linux servers. Check whether a system is vulnerable to certain tricks like a ./ removal that uses percent-encoded values like %2e%2e%2f. You can check for file extension by adding a null byte like %00 before you insert a valid extension. Manually implementing the above techniques can be time consuming and error prone for large web applications. Instead of doing this manually, you can use an automated tool. The following technologies are commonly used to automatically analyze input validation:Static application security testing (SAST)eAAAthese tools review the source code of the application when it is not running. SAST checks try to identify evidence of known insecure practices and vulnerabilities. SAST solutions employ white-box techniques.Dynamic application security testing (DAST)eAAAtools that communicate with the application through its front-end in order to identify security vulnerabilities. A DAST tool does not need any access to your source code. Rather, it simulates real attacks using a black-box strategy. Security checks are performed while executing or running the application or code under review. It also involves fuzzing, a technique used to submit random and malformed data as input to the web application, using it to uncover directory traversal vulnerabilities. vulnerabilities.
